ResQ – Emergency Response

Ideathon Presentation Speech · Easy-to-read speaking notes

1. Problem Statement

Imagine an ambulance reaches a patient on time, but the nearest hospital has no ICU beds available. Valuable time is lost searching for the right hospital.

As you can see, our emergency response system faces poor coordination, limited real-time resource information, and delays in accessing blood and medical facilities.

Two often-overlooked problems are hospital coordination with blood donation centres and time-consuming patient documentation. Even when the required blood is available, finding it quickly can be difficult. Similarly, paperwork and police-related formalities can delay the process.

Our idea, **ResQ – Emergency Response**, aims to connect ambulances, hospitals, blood banks, and patient information through one coordinated platform.

Because saving lives requires not just faster ambulances, but faster coordination at every step.

2. Solution

So, how exactly does ResQ solve these problems?

Our solution is to bring the entire emergency response system onto one coordinated platform.

As you can see, ResQ tracks ambulances in real time, estimates their arrival time, and helps identify the most suitable hospital based on the patient's needs and available facilities.

But what makes our solution more meaningful is that it goes beyond ambulance tracking. It connects hospitals, blood banks, NGOs, and donation organisations, helping them coordinate and share critical resources when lives are at stake.

We also aim to enable secure digital patient documentation and share essential patient information with hospitals before arrival, reducing delays during emergencies.

Through real-time alerts and communication, ResQ aims to ensure that everyone involved knows what is needed, where it is available, and how to respond faster.

Our vision is simple: one platform, connected emergency services, and a faster path from emergency to treatment.

3. Uniqueness

Now, what makes ResQ different from an ordinary emergency service application?

Our uniqueness lies in connecting the entire emergency response journey, rather than solving just one part of it.

ResQ brings ambulances, hospitals, patients, and doctors together on a single platform. It helps identify suitable hospitals based not just on distance, but also on the availability of essential resources.

Another key feature is connecting hospitals with blood banks, enabling faster coordination when blood or other medical resources are urgently needed.

We also combine live ambulance tracking with secure digital patient documentation, allowing essential information to reach hospitals before the patient arrives.

The real innovation is that these features work together. Instead of making separate calls, searching for resources, and completing everything independently, emergency teams can coordinate through one connected system.

That is what makes ResQ unique: not just faster transportation, but smarter coordination from emergency to treatment.

4. Implementation

Now, how do we turn this idea into reality? That brings us to our implementation plan.

ResQ will be developed as both a mobile application and a web platform, connecting ambulances, hospitals, blood banks, and emergency services.

Using GPS and live maps, we aim to track ambulances and plan routes, while real-time hospital updates help identify available beds, blood, and medical resources.

Another important part is secure digital patient registration and medical record sharing, so essential information can reach hospitals before the patient arrives.

We will begin with pilot testing in Bengaluru, evaluate how effectively the system works, and then expand citywide.

With partnerships involving hospitals and government authorities, our long-term vision is to scale ResQ to multiple cities.

We want to start locally, prove the impact, and then build a system that can help save lives on a much larger scale.
